

LAZARUS MUGO

Android Engineer

mugolazarusk@gmail.com | [LinkedIn](#) | [Portfolio](#) | [Github](#)

SUMMARY

Android Engineer with 3+ years of experience building and shipping production-grade mobile applications using Kotlin and modern Android architecture (Clean Architecture,MVI), including fintech features such as secure checkout and identity verification. I've owned Android applications end-to-end, from architecture and development to testing, CI/CD, and Play Store release, delivering scalable, maintainable, high-performance solutions.

With a design-aware eye, I bridge the gap between design intent and implementation, and I focus on writing clean, testable code that teams can confidently build on, while continuously improving performance, reliability, and developer workflows.

WORK EXPERIENCE

Mobile Engineer - Verse & Voice

Feb 2026 - June 2026

Verse & Voice is a personalized Bible app where I am the sole engineer across the entire product. I own the mobile app, the backend, and the marketing website, and the app is live and serving real users on Android and iOS.

- Built the Android and iOS app using Compose Multiplatform, owning the full lifecycle from architecture to store deployment
- Designed and implemented the Supabase backend, including database schema, authentication, and API layer, then conducted a full Row Level Security audit to close authorization gaps
- Coordinated tradeoffs across UX, backend design, and mobile performance as the only engineer on the product, prioritizing and delivering independently against the product owner's roadmap
- Built a custom local caching layer for offline audio/video playback using a semaphore-gated priority queue with atomic writes and a self-healing startup sweep, directly targeting offline reliability and performance

Head of Mobile & Chief Product Officer - Tajji Ltd

Jan 2025 - Feb 2026

As CPO & Head of Mobile at Tajji, I set technical and product direction for BomaOS and Jirani, leading a small mobile team while owning the shared infrastructure that powers both apps across Android, iOS, and desktop.

- Architect and maintain 6+ internal KMP libraries in production, that is authentication, identity verification, i18n, feature flags, customer support, and secret management; powering two live apps across Android, iOS, and desktop
- Built SDK wrappers that eliminated per-platform code duplication, so the team ships a feature once instead of maintaining separate Android and iOS implementations
- Built the entire mobile DevOps stack from zero, including CI/CD pipelines, crash analytics, product analytics, and automated Play Store deployment
- Lead the mobile team across architecture direction, code reviews, and cross-functional alignment with product and design
- Wrote native Swift interop code to bridge KMP shared modules into iOS, handling platform-specific integration points beyond what Compose Multiplatform covers automatically

I led the end-to-end development of two production Android apps, BomaOS and Jirani, taking both from initial architecture through to Play Store deployment. Beyond shipping the apps, I built the internal tooling and standards that the whole mobile team now runs on.

- Led development of BomaOS and Jirani from first commit to Play Store, owning architecture, implementation, code reviews, and the final deployment
- Built the internal design system (components, typography, spacing, theming), drawing on prior UI/UX design experience to keep engineering output aligned with product intent
- Integrated backend services using REST APIs and asynchronous data handling with Coroutines and Flow
- Set the architectural patterns and code standards (Clean Architecture, MVI, Coroutines, Flow) that became the baseline every pull request was reviewed against
- Established a Figma-to-code workflow that closed the gap between what design shipped and what actually landed in the app

MyLifePool is a UK community support platform that needed a full technical overhaul. I came in to rewrite the app from a legacy stack and put the infrastructure in place to support the team long after I handed it over.

- Rewrote the legacy Ionic/WordPress app into a modern Kotlin Multiplatform codebase, with scalability and maintainability as the core architectural goals
- Built CI/CD pipelines and automated testing from scratch, taking the app from zero DevOps infrastructure to a successful public beta launch

Started out building the Boma web platform and PWA in SvelteKit, working closely with the UI/UX team before the product transitioned to native Android and iOS.

- Built and maintained the BomaOS web platform and PWA using SvelteKit, before the product transitioned to native Android and iOS
- Worked closely with the UI/UX team on interface design and product decisions, an early foundation for the design-aware approach I still bring to engineering work today
- Gained hands-on experience with frontend architecture and component design, laying the groundwork for the mobile architecture standards I later set as Lead Mobile Application Developer

KEY TECHNICAL SKILLS

- Android Development: Kotlin, Android SDK, Jetpack Compose, Jetpack (ViewModel, Navigation, LiveData, WorkManager)
- Architecture & Patterns: Clean Architecture, MVVM, MVI, SOLID Principles, Dependency Injection (Koin)
- Networking & Data: REST APIs, Ktor Client, Coroutines, Flow
- Storage: Room, SQLite
- Tools & Platforms: Android Studio, Gradle, Firebase Cloud Messaging, Git, CI/CD (GitHub Actions), Google Play Console
- Testing: Mockito
- Practices: Agile/Scrum, Code Review, App Security Best Practices

EDUCATION

BSc. Computer Science Kabarak University Major in Software Engineering. 2019 - 2023	Android Development Certification Zalego Institute of Technologfy and Innovation Android Development 2017 -2018
